

## DELIVERY MANAGEMENT

Biosite's online Delivery Management system enables the easy booking of deliveries and resources such as cranes, and allows the recording of information when they arrive. Subcontractors can pre request a delivery slot and resources, which is then reviewed and approved by site, with full notifications.

### Benefits

- Clear visibility of available booking times and site resources.
- Log of expected deliveries allowing sites to manage their site vehicle movements efficiently.
- Ability to enforce subcontractors to view traffic management plan before being able to request a booking.
- Prevents the double booking of time slots.

### Features

- Intuitive, calendar based management of booking times and site resources.
- Log deliveries on arrival and departure.
- Role based permission access.
- Amend, copy and delete bookings within pre defined time constraints.
- Delivery information visible to all users on site or remotely.
- Deliveries can be entered rapidly by type: materials, contractors, hauliers etc.
- Visibility of key equipment, delivery points, cranes, hoists, loading bays etc.
- Synchronise with Biosite Access Control to reduce double entry.

### Carbon reporting

The information logged through Biosite's Delivery Management tool can be reported in its own right, or used by the carbon reporting suite to compute CO2 emissions data necessary for BREEAM reporting.
