

# Card Reader solution

Trusted temporary site access, ensuring you have the right operatives on site, at all times.

## Seamless integration with Biosite systems

---

When a card system is the most appropriate form of temporary access, Biosite's solution can seamlessly and securely integrate with Biosite software systems to provide a flexible solution. Card readers can be quickly and easily mounted onto hardware such as turnstiles and maglocks alongside biometric systems (such as fingerprint scanners), to offer operatives a choice of access.

## Powerfully secure

---

The microprocessor in Biosite's card reader generates operative credentials, which are cross-referenced with Biosite's Access control system database. If permission is granted, the operative will be approved for access to site. For additional identity data protection, the reader's Secure Identity Object® (SIO®) data model provides an extra layer of encryption. The system enables direct printing of operative cards on site and each card contains visual operative data for easy identification.

For added reassurance, Biosite's card reader solution is compliant with the Open Supervised Device Protocol (OSDP). Developed by the Security Industry Association (SIA) for high-security environments, OSDP is a recommended best practice standard established to improve interoperability between access control and security products.

## A sustainable solution

---

Intelligent power management in the Biosite system reduces power consumption by as much as 59%, compared to alternative card reader systems.

## Ensure best practice hygiene on site
